

CLAIM AMENDMENTS

Claim Amendment Summary

Claims pending

- Before this Amendment: Claims 1-11 and 13-23.
- After this Amendment: Claims 1-11 and 13-23

Non-Elected, Canceled, or Withdrawn claims: 12

Amended claims: xxx

New claims: none

Claims:

1. (Previously Presented) A computer storage medium for facilitating resolution of partially unresolved input, the medium having computer executable instructions, the instructions comprising:

parsing a sequence of object-based commands into individual object-based commands;

associating each individual object-based command with at least one execution element;

executing each execution element associated with each individual object-based command to produce output objects, the executing act comprising processing each execution element in order of each execution element's associated individual object-based commands in the sequence of object-based commands and inputting into one or more execution elements

output objects produced from one or more previously processed execution elements,

wherein the parsing, associating, and executing acts facilitate resolution of partially unresolved input.

2. (Previously Presented) The computer storage medium of claim 1, wherein the execution of each execution element is execution dependent upon an execution-supporting operating environment to actually execute, the instructions further comprising resolving each object-based command in the sequence of object-based commands to a data type.

3. (Previously Presented) The computer storage medium of claim 2, wherein the data type is not natively supported by the operating environment, the processing further comprises retrieving extended information that defines the data type and creating an instance of the data type for each object-based command in the sequence.

4. (Previously Presented) The computer storage medium of claim 3, wherein the extended information comprises extended metadata and code, the extended metadata describes the data type and the code comprises additional instructions to populate the instance of the data type.

5. (Previously Presented) The computer storage medium of claim 1, further comprising:

receiving the sequence of object-based commands via an object-based command pipeline, wherein the sequence of object-based commands includes a wildcard; and

producing a subset of the sequence of object-based commands based on the wildcard.

6. (Previously Presented) The computer storage medium of claim 1, further comprising:

receiving the sequence of object-based commands via an object-based command pipeline, wherein the sequence of object-based commands includes a property set; and

identifying a plurality of properties associated with the property set and processing the sequence of object-based commands based on the plurality of properties.

7. (Previously Presented) The computer storage medium of claim 1, further comprising:

receiving the sequence of object-based commands via an object-based command pipeline, wherein the sequence of object-based commands includes a relation; and

finding items that the sequence of object-based commands consume based on the relation.

8. (Previously Presented) The computer storage medium of claim 1, further comprising receiving the sequence of object-based commands via an object-based command pipeline, wherein the sequence of object-based commands comprises a property path, the property path comprises a series of components that provide navigation to a desired property of each object-based command in the sequence.

9. (Previously Presented) The computer storage of claim 2, wherein the sequence of object-based commands is associated with a first data type and the processing further comprising looking up a conversion that converts the first data type to the data type.

10. (Previously Presented) The computer storage medium of claim 8, wherein each component comprises a property of each object-based command in the sequence, a method of each object-based command in the sequence, a field of each object-based command in the sequence, a third party property, or a third party object method.

11. (Previously Presented) The computer storage medium of claim 1, wherein the sequence of object-based commands is received as input to a subsequent command in the object-based command pipeline after processing the sequence of object-based commands

12. (Canceled)

13. (Previously Presented) The computer storage medium of claim 8, wherein a component comprises a reference to registered code.

14. (Previously Presented) A computer storage medium for facilitating resolution of partially unresolved input, the medium having computer executable instructions, the instructions comprising:

receiving one or more parseable input objects, the input objects being output from an already processed execution element that is associated with one or more object-based commands of a sequence of commands obtained via an object-based command pipeline within an execution-supporting operating environment, the one or more parseable input objects including content that

uses a data type that is not natively supported by the execution-supporting operating environment, wherein the execution of an execution element is execution dependent upon the execution-supporting operating environment to actually execute;

retrieving extended information that defines the data type; and

creating an instance of the data type,

wherein the receiving, retrieving, and creating acts facilitate resolution of partially unresolved input.

15. (Previously Presented)

The computer storage medium of claim 14, wherein the one or more parseable input objects comprises a Windows Management Instrumentation (WMI) input, an ActiveX Data Object (ADO) input, an XML input, or a third party data format.

16. (Previously Presented)

The computer storage medium of claim 14, wherein the extended information comprises extended metadata and code, the extended metadata describes the data type and the code comprises additional instructions to populate the instance of the data type.

17. (Previously Presented)

The computer storage medium of claim 14, wherein the one or more parseable input objects comprises a third party object that provides an additional property to an object supported natively within the execution-supporting operating environment.

18. (Previously Presented) The computer storage medium of claim 14, wherein the one or more parseable input objects comprises an ontology service.

19. (Previously Presented) A system that extends data types available to an operating environment, the system comprising:

- a processor; and

- a memory, the memory being allocated for a plurality of computer-executable instructions which are loaded into the memory for execution by the processor, the computer-executable instructions comprising:

 - parsing a sequence of object-based commands into individual object-based commands;

 - associating each individual object-based command with at least one execution element;

 - executing each execution element associated with each individual object-based command to produce output objects, the executing act comprising processing each execution element in order of each execution element's associated individual object-based commands in the sequence of object-based commands and inputting into one or more execution elements output objects produced from one or more previously processed execution elements,

 - wherein the parsing, associating, and executing acts facilitate resolution of partially unresolved input.

20. (Previously Presented) The system of claim 19, wherein the execution of each execution element is execution dependent upon an execution-supporting operating environment to actually execute, the instructions further comprising resolving each object-based command in the sequence of object-based commands to a data type.

21. (Previously Presented) The system of claim 20, wherein the instructions further comprising receiving the sequence of object-based commands via an object-based command pipeline, wherein the sequence of object-based commands comprises a property path, the property path comprises a series of components that provide navigation to a desired property of each object-based command in the sequence.

22. (Previously Presented) The system of claim 21, wherein the extended information comprises extended metadata and code, the extended metadata describes the data type and the code comprises additional instructions to populate the instance of the data type.

23. (Previously Presented) The system of claim 20, wherein the sequence of object-based commands is associated with a first data type and the processing further comprising looking up a conversion that converts the first data type to the data type.
